2017	Angular 6 Course - From zero to hero

Online Store

Online store app with front-end in Angular and back-end in PHP

A Angular + *php* PHP

The front-end is done in **Angular**.
The back-end is done in **PHP** and the database is **MySQL**.
The front-end is hosted on **Google Firebase** and the back-end on **Ionos**.

I did the **design** and **prototypes** myself in **Figma**, as I wanted to know exactly what I was going to do before writing a line of code.

A See application

See Angular front-end repo

See PHP back-end repo

See designs and prototypes

Architecturer

Corporate website of an architecture studio in Google's AMP

⚡ AMP

AMP (**Accelerated Mobile Pages**) is an **ultra-fast loading** technology **from Google** that works very well, among other things, for landing pages of campaigns in **Google Ads**, where every second that it takes to load the website is money lost.

The page is optimized so that Google's official loading seed audit (**Lighthouse**) shows virtually no errors.
